Reply to Office Action of January 26, 2004

1. (Previously presented) A computer-implemented method for collecting information relating to execution of an application, the method comprising: determining a set of probe locations in the application at which collecting data

relating to the execution of the application would produce non-redundant information by eliminating pairs of probe locations that would produce redundant information; and inserting probes only at the determined probe locations in the application.

- 2. (Original) The method of claim 1, further comprising determining entry and exit points of a plurality of functions constituting at least a portion of the application.
- 3. (Original) The method of claim 2, further comprising identifying the entry and exit points as probe locations at which probes are to be inserted.
- 4. The method of claim 1, further comprising: (Original) identifying a first location within the application at which a function call directs execution of the application to a second location outside of a current module; and inserting a first probe before the identified first location and a second probe after the identified first location.
- 5. The method of claim 4, wherein the first probe is configured to (Original) collect an address of a first function in which the identified first location is located, an address of a second function in which the second location is located, a first stack pointer, and a first time indicator, and the second probe is configured to collect the address of the second function, a second stack pointer, and a second time indicator.
- 6. (Original) The method of claim 1, further comprising: identifying a first location within a calling function at which execution of the application is directed to a called function having an exit point at which execution of the application is directed to a second location outside of the calling function; and

inserting a first probe before the first location and a second probe after the second location.

- 7. (Original) The method of claim 6, wherein the first probe is configured to collect an address of the calling function, an address of the called function, a first stack pointer, and a first time indicator, and the second probe is configured to collect the address of the called function, a second stack pointer, and a second time indicator.
- 8. (Original) The method of claim 1, further comprising:
 identifying a block of code to which execution of the application is directed upon occurrence of an error; and

inserting a first probe at a beginning of the identified block of code and a second probe at an end of the identified block of code.

- 9. (Original) The method of claim 8, wherein the first probe is configured to collect an address of the block of code, a first stack pointer, and a first time indicator, and the second probe is configured to collect the address of the block of code, a second stack pointer, and a second time indicator.
- 10. (Original) The method of claim 1, further comprising using the inserted probes to collect the information relating to the execution of the application.
- 11. (Original) The method of claim 10, further comprising analyzing the collected information.
- 12. (Currently amended) A computer-implemented method for collecting information relating to execution of an application, the method comprising:

determining entry and exit points of a plurality of functions constituting at least a portion of the application;

App. No. 09/560,269 Amendment dated April 6, 2004 Reply to Office Action of January 26, 2004

determining a set of probe locations in the application at which collecting data relating to the execution of the application would produce non-redundant information by eliminating pairs of probe locations that would produce redundant information, the set of probe locations including at least the entry and exit points of the functions;

inserting probes only at the determined probe locations in the application; using the inserted probes to collect the <u>non-redundant</u> information relating to the execution of the application; and

analyzing the collected information.

13. (Original) The method of claim 12, further comprising:

identifying a first location within the application at which a function call directs execution of the application to a second location outside of a current module; and

inserting a first probe before the identified first location and a second probe after the identified first location,

wherein the first probe is configured to collect an address of a first function in which the identified first location is located, an address of a second function in which the second location is located, a first stack pointer, and a first time indicator, and the second probe is configured to collect the address of the second function, a second stack pointer, and a second time indicator.

14. (Original) The method of claim 12, further comprising:
identifying a first location within a calling function at which execution of the application is directed to a called function having an exit point at which execution of the application is directed to a second location outside of the calling function; and

inserting a first probe before the first location and a second probe after the second location,

wherein the first probe is configured to collect an address of the calling function, an address of the called function, a first stack pointer, and a first time indicator, and the second probe is configured to collect the address of the called function, a second stack pointer, and a second time indicator.

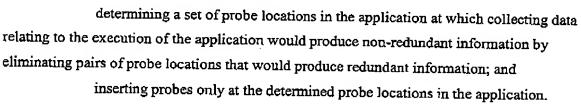

Reply to Office Action of January 26, 2004

15. (Original) The method of claim 12, further comprising: identifying a block of code to which execution of the application is directed upon occurrence of an error; and

inserting a first probe at a beginning of the identified block of code and a second probe at an end of the identified block of code,

wherein the first probe is configured to collect an address of the block of code, a first stack pointer, and a first time indicator, and the second probe is configured to collect the address of the block of code, a second stack pointer, and a second time indicator.

16. (Previously presented) A computer-readable medium having an application including computer-executable instructions for:

- 17. (Original) The computer-readable medium of claim 16, having further computer-executable instructions for determining entry and exit points of a plurality of functions constituting at least a portion of the application.
- 18. (Original) The computer-readable medium of claim 17, having further computer-executable instructions for identifying the entry and exit points as probe locations at which probes are to be inserted.
- 19. The computer-readable medium of claim 16, having further (Original) computer-executable instructions for:

identifying a first location within the application at which a function call directs execution of the application to a second location outside of a current module; and

inserting a first probe before the identified first location and a second probe after the identified first location.

- 20. (Original) The computer-readable medium of claim 19, wherein the first probe is configured to collect an address of a first function in which the identified first location is located, an address of a second function in which the second location is located, a first stack pointer, and a first time indicator, and the second probe is configured to collect the address of the second function, a second stack pointer, and a second time indicator.
- 21. (Original) The computer-readable medium of claim 16, having further computer-executable instructions for:

identifying a first location within a calling function at which execution of the application is directed to a called function having an exit point at which execution of the application is directed to a second location outside of the calling function; and

inserting a first probe before the first location and a second probe after the second location.

- 22. (Original) The computer-readable medium of claim 21, wherein the first probe is configured to collect an address of the calling function, an address of the called function, a first stack pointer, and a first time indicator, and the second probe is configured to collect the address of the called function, a second stack pointer, and a second time indicator.
- 23. (Original) The computer-readable medium of claim 16, having further computer-executable instructions for:

identifying a block of code to which execution of the application is directed upon occurrence of an error; and

inserting a first probe at a beginning of the identified block of code and a second probe at an end of the identified block of code.

24. (Original) The computer-readable medium of claim 23, wherein the first probe is configured to collect an address of the block of code, a first stack pointer, and a first time indicator, and the second probe is configured to collect the address of the block of code, a second stack pointer, and a second time indicator.

- 25. (Original) The computer-readable medium of claim 16, having further computer-executable instructions for using the inserted probes to collect the information relating to the execution of the application.
- 26. (Original) The computer-readable medium of claim 25, having further computer-executable instructions for analyzing the collected information.
- 27. (Currently amended) A computer-readable medium having an application including computer-executable instructions for:

determining entry and exit points of a plurality of functions constituting at least a portion of the application;

determining a set of probe locations in the application at which collecting data relating to the execution of the application would produce non-redundant information by eliminating pairs of probe locations that would produce redundant information, the set of probe locations including at least the entry and exit points of the functions;

inserting probes only at the determined probe locations in the application; using the inserted probes to collect the <u>non-redundant</u> information relating to the execution of the application; and

analyzing the collected information.

28. (Original) The computer-readable medium of claim 27, having further computer-executable instructions for:

identifying a first location within the application at which a function call directs execution of the application to a second location outside of a current module; and

inserting a first probe before the identified first location and a second probe after the identified first location,

wherein the first probe is configured to collect an address of a first function in which the identified first location is located, an address of a second function in which the second location is located, a first stack pointer, and a first time indicator, and the second probe is

configured to collect the address of the second function, a second stack pointer, and a second time indicator.

29. (Original) The computer-readable medium of claim 27, having further computer-executable instructions for:

identifying a first location within a calling function at which execution of the application is directed to a called function having an exit point at which execution of the application is directed to a second location outside of the calling function; and

inserting a first probe before the first location and a second probe after the second location,

wherein the first probe is configured to collect an address of the calling function, an address of the called function, a first stack pointer, and a first time indicator, and the second probe is configured to collect the address of the called function, a second stack pointer, and a second time indicator.

30. (Original) The computer-readable medium of claim 27, having further computer-executable instructions for:

identifying a block of code to which execution of the application is directed upon occurrence of an error; and

inserting a first probe at a beginning of the identified block of code and a second probe at an end of the identified block of code,

wherein the first probe is configured to collect an address of the block of code, a first stack pointer, and a first time indicator, and the second probe is configured to collect the address of the block of code, a second stack pointer, and a second time indicator.

31. (Previously presented) A computer arrangement configured to execute an application including computer-executable instructions for:

determining a set of probe locations in the application at which collecting data relating to the execution of the application would produce non-redundant information by eliminating pairs of probe locations that would produce redundant information; and

inserting probes only at the determined probe locations in the application.

- 32. (Original) The computer arrangement of claim 31, further configured to execute computer-executable instructions for determining entry and exit points of a plurality of functions constituting at least a portion of the application.
- 33. (Original) The computer arrangement of claim 32, further configured to execute computer-executable instructions for identifying the entry and exit points as probe locations at which probes are to be inserted.
- 34. (Original) The computer arrangement of claim 31, further configured to execute computer-executable instructions for:

identifying a first location within the application at which a function call directs execution of the application to a second location outside of a current module; and

inserting a first probe before the identified first location and a second probe after the identified first location.

- 35. (Original) The computer arrangement of claim 34, wherein the first probe is configured to collect an address of a first function in which the identified first location is located, an address of a second function in which the second location is located, a first stack pointer, and a first time indicator, and the second probe is configured to collect the address of the second function, a second stack pointer, and a second time indicator.
- 36. (Original) The computer arrangement of claim 31, further configured to execute computer-executable instructions for:

identifying a first location within a calling function at which execution of the application is directed to a called function having an exit point at which execution of the application is directed to a second location outside of the calling function; and

inserting a first probe before the first location and a second probe after the second location.

- 37. (Original) The computer arrangement of claim 36, wherein the first probe is configured to collect an address of the calling function, an address of the called function, a first stack pointer, and a first time indicator, and the second probe is configured to collect the address of the called function, a second stack pointer, and a second time indicator.
- 38. (Original) The computer arrangement of claim 31, further configured to execute computer-executable instructions for:

identifying a block of code to which execution of the application is directed upon occurrence of an error; and

inserting a first probe at a beginning of the identified block of code and a second probe at an end of the identified block of code.

- 39. (Original) The computer arrangement of claim 38, wherein the first probe is configured to collect an address of the block of code, a first stack pointer, and a first time indicator, and the second probe is configured to collect the address of the block of code, a second stack pointer, and a second time indicator.
- 40. (Original) The computer arrangement of claim 31, further configured to execute computer-executable instructions for using the inserted probes to collect the information relating to the execution of the application.
- 41. (Original) The computer arrangement of claim 40, further configured to execute computer-executable instructions for analyzing the collected information.
- 42. (Currently amended) A computer arrangement configured to execute an application including computer-executable instructions for:

determining entry and exit points of a plurality of functions constituting at least a portion of the application;

determining a set of probe locations in the application at which collecting data relating to the execution of the application would produce non-redundant information by

eliminating pairs of probe locations that would produce redundant information, the set of probe locations including at least the entry and exit points of the functions;

inserting probes only at the determined probe locations in the application; using the inserted probes to collect the <u>non-redundant</u> information relating to the execution of the application; and

analyzing the collected information.

43. (Original) The computer arrangement of claim 42, further configured to execute computer-executable instructions for:

identifying a first location within the application at which a function call directs execution of the application to a second location outside of a current module; and

inserting a first probe before the identified first location and a second probe after the identified first location,

wherein the first probe is configured to collect an address of a first function in which the identified first location is located, an address of a second function in which the second location is located, a first stack pointer, and a first time indicator, and the second probe is configured to collect the address of the second function, a second stack pointer, and a second time indicator.

44. (Original) The computer arrangement of claim 42, further configured to execute computer-executable instructions for:

identifying a first location within a calling function at which execution of the application is directed to a called function having an exit point at which execution of the application is directed to a second location outside of the calling function; and

inscrting a first probe before the first location and a second probe after the second location,

wherein the first probe is configured to collect an address of the calling function, an address of the called function, a first stack pointer, and a first time indicator, and the second probe is configured to collect the address of the called function, a second stack pointer, and a second time indicator.

45. (Original) The computer arrangement of claim 42, further configured to execute computer-executable instructions for:

identifying a block of code to which execution of the application is directed upon occurrence of an error; and

inserting a first probe at a beginning of the identified block of code and a second probe at an end of the identified block of code,

wherein the first probe is configured to collect an address of the block of code, a first stack pointer, and a first time indicator, and the second probe is configured to collect the address of the block of code, a second stack pointer, and a second time indicator.

- 46. (New) The method of Claim 1, wherein the determining, inserting and collecting occur at a time other than when the application is being compiled.
- 47. (New) The method of Claim 12, wherein the determining, inserting, using and analyzing occur at a time other than when the application is being compiled.
- 48. (New) The computer-readable medium of Claim 16, wherein the determining, inserting and collecting occur at a time other than when the application is being compiled.
 - 49. (New) The computer-implemented medium of Claim 27, wherein the determining, inserting, using and analyzing occur at a time other than when the application is being compiled.
 - 50. (New) The computer arrangement of Claim 31, wherein the determining, inserting and collecting occur at a time other than when the application is being compiled.
 - 51. (New) The computer arrangement of Claim 42, wherein the determining, inserting, using and analyzing occur at a time other than when the application is being compiled.
